ATMOSPHERIC
ADMINISTRATION

National Environmental Satellite,
Data, and Information Service

The National Environmental Satellite, Data, and Information Service (NESDIS) is the fourth largest satellite service in the world, joining the National Aeronautics and Space Administration (NASA), the Soviet Space Agency, and the U.S. Department of Defense in monitoring the earth from the space frontier. NESDIS's satellite images are highly visible on nightly television weather forecasts. NOAA's satellite division helps the American public by:

- Providing images used daily by the National Weather Service forecasters to issue warnings of hurricanes, severe thunderstorms and flash floods.
- Determining the temperature structure of the atmosphere to within 3 degrees Celsius.
- Saving lives (more than 1,500 since 1982) by picking up Search and Rescue beacons from downed ships and aircraft.
- Providing daily worldwide monitoring of volcanic eruptions, tropical cyclones and forest fires, thus preventing airline disasters and loss of lives.
- Measuring global ozone amounts.
- Monitoring sea surface temperatures, aiding the fishing industry in locating fish and helping shipping interests to use faster currents to save fuel.

- 2 -

In addition, NESDIS operates global data centers that record and make measurement data available to scientists and the general public. These centers currently house the largest data bank of environmental data in the world, most of it accessible through a state-of-the-art electronic retrieval system.
